

Section 3

Comparative Analysis

Growth – Stability - Impact

Sample Area

Comparative Analysis - Introduction

The author Robert Burns wrote, "Oh would some power the Giftie give us to see ourselves as others see us." Having proper perspective is very important. This is one of the features of the "Comparative Analysis" section of this report.

The comparison method has been chosen since the importance and relevance of economic growth percentages has always been somewhat subjective.

As an example, an area might have a 2% increase in employment for a given year and the local newspaper reports this fact. One reader might interpret the 2% figure as "great." Since employment went up, things must be good. Another reader however looks at the 2% as a modest gain and feels the local economy needs a "jump start." With the 2% number just dangling, community leaders have no alternative but to give subjective opinions to its relevance.

By comparing the growth rate to the rest of the nation in a uniform and consistent manner, the numbers gain much more meaning. If it is discovered the 2% rate happened to be either the fastest or slowest rate in the nation, community leaders have a much better perspective of the condition of their local economy.

Not only is it important to study the growth rate of the economic elements of an area, but it is equally important to examine how and in what manner the growth occurred. Some areas grow, or decline, in a consistent manner. Others have boom, bust cycles. The stability of the growth is a reflection of the character of the economy.

In this section, the growth rate, the stability, and the economic importance of sixty-six items are calculated and compared to the rest of the nation. From this information, the reader can determine the most or least important elements of the economy and discover if they are growing or declining relative to the rest of the nation.

Guide to Understanding the Data - Methodology

Two “data sets” are used for the comparative analysis.

- **Data Set 1 – All Years** includes economic information which has been collected using the same methodology since at least 1970. Included are 42 items for which the annual growth rate has been calculated and ranked for the five years from 2005 – 2009, the ten years from 2000 to 2009, and the previous ten years from 1990 to 1999. Short and long term trends can be reviewed using this data set.
- **Data Set 2 – NAICS Industry Data** includes the most recently published industry data based upon the North American Industrial Classification System. Data was first collected under the NAICS system in 2001. For each of the 24 NAICS industrial sectors, the employment, earnings, and wage growth has been calculated and ranked.

AAI – Economic Growth

Economic Growth is the rate of increase or decrease of the item. Growth rates are shown as a percentage of increase. For all data sets, the Average Annual Increase (AAI) has been calculated for the various time periods. The mathematics for this calculation is rather simple. For each year of the study period, the percentage increase from the previous year is calculated and averaged for the term.

DF – Economic Stability

Areas grow and decline economically in different manners and at different rates. Local economies are subject to rapid shifts. Due to changes in the strength of the primary industries which support the area, local economies can rise and fall, boom and bust, from year to year. Simply identifying the areas that have highest or lowest growth rates is insufficient. The rate, consistency, or stability of the growth is equally important.

Areas with unstable, boom and bust economies are difficult places to conduct business. Residents of the area are subject to economic uncertainty and stress. A merchant may lease extra floor space following three or four great years, only to go bankrupt after a subsequent economic decline. Residents might make long term financial commitments based upon rapid increases in earnings and employment growth, only to lose everything due to a sudden downturn causing massive layoffs.

Since the concept of measuring the consistency or stability of economic growth is so important, it is appropriate to examine this measurement in greater detail so the information provided in the data sets can be thoroughly understood.

To better understand the nature of economic stability, we will examine the consistency of the construction industry for three areas which had the same average annual percentage increase.

The first graph depicts a Mythical Area, which had an Average Annual Percentage Increase (AAI) in Construction Jobs of 2.5% from 2001 through 2009 (2001 is the first year NAICS based data was published).

Mythical Area had a 2.5% increase from 2002 to 2003. From 2003 to 2004 it again had a 2.5% increase. Each and every year, the area increased exactly 2.5%. This means construction employers, each and every year, increased the number of people they employed by 2.5%.

As a result, by averaging the nine-year history, the Mythical Area, obviously, had a 2.5% average annual percentage increase (AAI).

Most importantly, the area had perfect consistency as depicted by the straight horizontal line on the graph. The flow of money into the area, which supports this industry, grew in an absolutely consistent manner. This is a perfect situation. However, this is myth, not reality.

Let us examine the economic stability of the Great Falls, MT MSA for the same element. Great Falls, during the same nine years had an AAI in Construction Jobs of 2.5%. This rate of growth ranked 35th highest among the 366 metropolitan areas for the nine-year period.

The graph shows the percentage increase or decline each year. You can see the rate of growth is not absolutely stable.

While over the nine years it averages 2.5%, there are obvious fluctuations year by year. From 2001-2002, there was a 7.5% decline in construction employment. The next year a 6.2% increase. The next year a 6.3% increase, so on and so forth.

For the nine years, the average of the annual increases is 2.5%. However, the rate of growth is not nearly as stable as the Mythical Area. The growth line is not straight but goes up and down.

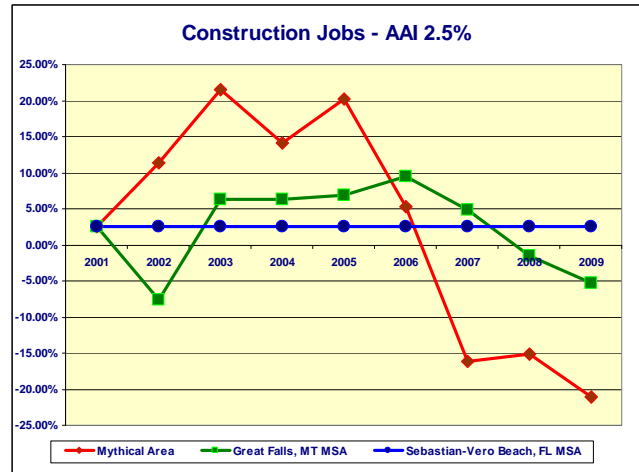

While the rate of growth of Construction Jobs for Great Falls is not absolutely consistent, it is considerably more stable than the Sebastian – Vero Beach, FL metropolitan area.

As with Great Falls and the Mythical Area, Sebastian – Vero Beach had an average annual increase of 2.5% over the nine years. As you can see in the graph, the rate of growth was extremely volatile.

From 2001-2002, the Sebastian – Vero Beach area gained 11%, the next year gained 21%, then 14% then 20%. However, in 2007 it lost 16% of its construction jobs, then 15%, then 21%.

Yes, the average of all of these years is 2.5%. How it happened is considerably different than Great Falls.

Obviously, simply relying upon economic growth percentages is not sufficient in order to determine the character of a local economy. Economic stability must be considered.

To measure economic stability, the difference or deviation in each successive year's percentage of growth is calculated (absolute number) and averaged, creating the Average Deviation from Previous Year (DEV).

To determine the measurable consistency of growth, the DEV is subtracted from the AAI. This number is used for POLICOM's economic strength rankings. Inconsistent economies area ranked lower than consistent economies.

AVG – Average for the Term

For each of the three time periods, the Average of the actual data for the item is provided. As an example, for “Construction – Earnings” the AVG would be the amount of actual earnings by those employed in Construction over the time period. If over the 5-Year Term, the earnings for the individual years were \$500,000,000, \$550,000,000, \$600,000,000, \$650,000,000, and \$700,000,000 respectively, the average for the term would be \$600,000,000.

The actual data for each item for the most recent year and 20 years prior is provided.

% - Percentage of Importance

The percentage (%) the item is of the area economy is provided when it is appropriate. This represents the weight or importance the item is in the economy. By studying these percentages, you can determine which of the items have the greatest or least impact upon your economy. One item might have extremely high growth rates within the economy, but its percentage of the economy might be so low that it is insignificant.

The percentage (%) is calculated by taking the **AVG** data for a time period and dividing it by the total for the area of the respective general category.

As an example, if “Construction – Earnings” averaged \$600,000,000 for the 5-Year Term and the average of the “Earnings – All Workers” for the area was \$7,500,000,000, then the earnings

by those employed in Construction represents 8% of all the earnings in the area, on average, for the five years.

For the most recent and earliest years, once again actual data is used and the percentage is for each respective year. There is a footnote under each page explaining what the percentage represents for each item.

By comparing the “%” to the nation and the comparison areas, you can determine if some industries in your economy are abnormally high or low relative to the composition of the economy.

Rank

For each calculation, following **AAI**, **DF**, **AVG**, and **%**, there is a **Rank**. Rank is the direct comparison of each element to either the 366 defined Metropolitan Areas or the 576 Micropolitan Areas in the United States. The Rank provides the relative position each element is to the rest of the nation.

From the Rank, you can determine if the growth for the area is high or low, the stability good or bad, the relative size of the economy (AVG), and how the composition of the economy (%) compares to other economies in the United States.

To determine the Rank, data for each of the 366 metropolitan areas and/or the 576 Micropolitan Areas was extracted, calculated and ranked.

Terms to Understand

The following is an explanation of several of the terms used in this section.

Earnings: With the exception of “Wage & Salaried Workers – Earnings,” this includes all wages & salaries paid to workers, the earnings of proprietors, and “Other Labor Income.” Generally, “Other Labor Income” includes the employer and proprietor contributions to private retirement programs. For earnings under “Wage & Salaried Workers – Earnings,” earnings do not include “Other Labor Income” but reflects just wages and salaries paid to individuals who work for others. Earnings are in \$000.

Employment or Jobs: Includes all full and part-time wage and salaried workers and full and part-time proprietors. Under “Non Farm Proprietors – Employment,” Jobs reflect the number of proprietors.

Wages: Denotes the “Annual Earnings per Worker” for each category. This is derived by dividing the total earnings in each industry by the total employment in each industry.

Proprietors or Non Farm Proprietors: An unincorporated business or partnership. Typically the “small businesses” in an area, a “proprietor” can be full or part-time. Proprietor earnings are typically derived from Federal Income Tax filings.

Population and Per Capita: Population reflects the “mid-year” estimate by the Bureau of Census. Per Capita calculations are created by dividing the item by the population estimate for each year.

Comparison Areas

Data is provided for the United States (USA) along with the average of the Metropolitan areas (USA MET) and the non-metropolitan portion of the country (NON MET) which is basically “rural American.”

Data for any state which is shown is ranked against the remaining 49 states.

Metropolitan Statistical Areas are ranked against the 365 other MSA’s. Micropolitan Statistical Areas are ranked against the other 575 other MicSA’s.

Rural counties are ranked against the MicSA’s.

For some items, a “0” or “na” will appear for one or more time periods or for the entire data item. This means the data has been suppressed to prevent disclosure or there was too little data to be included in the area totals.

Data Set 1 - All Years

Data Set 1 – All Years includes economic information which has been collected using the same methodology since at least 1970. Included are 42 items for which the annual growth rate has been calculated and ranked for the five years from 2005 – 2009, the ten years from 2000 to 2009, and previous ten years from 1990 to 1999. Short and long term trends can be reviewed using this data set.

Data Set 2 - Industry Data

Data Set 2 – Industry Data includes the most recently published industry data based upon the North American Industrial Classification System. Data is provided for 2009 and 2001. For each of the 24 NAICS industrial sectors, the employment, earnings, and wage growth has been calculated and ranked. Definitions for the industrial sectors appear in Section 4.
